

You will find out what leaving costs on the **worst possible day.**

The day the price changes. Exit Check answers the question in advance, keeps a copy outside every platform you depend on, opens that copy to prove it is readable, and reports what did not come out.

THE ENTIRE OUTPUT OF THE PRODUCT

Leaving Notion today would take about 34 hours and no direct spend, and you would leave behind databases, database relations, comments, sharing and permissions and page history.

154 h

of work to be running elsewhere, across one ordinary six service portfolio

390,834

items that would not come with you, of the 573,461 you hold

0

of those six platforms, what leaving would cost

Exit cost, measured

Notion		64
Evernote		54
Slack, free		53

Four steps

- 1 Run the platform's own export**
Every day, week or month, without any remembering to.
- 2 Write the copy where you control it**
Exit Check never holds the only copy of

Figma		46
Google Photos		28
GitHub		26

Six weighted factors, each read from a field you can inspect. No model produces this number, which is why you are allowed to disagree with it. One rule overrides the arithmetic: if more than a quarter of what you hold cannot be exported at all, the service is trapped whatever the score says.

- 3

Open it, and say what is mis
A download that never gets opened is
Files are parsed, not counted.
- 4

Answer in one sentence
Hours, money, and exactly what stays b

What it deliberately is not

Not a model, because a number you cannot argue
is a number you cannot trust. Not a migration tool
because moving your data is a different product v
different failure mode. Not another place your dat
lives. And not a dashboard to visit: it should stay s
until a number moves, then send one sentence.

No model. No migration. No new place your data lives.

A working prototype runs with `npm install && npm run dev`
